What is it? Audio Lab is a set of tools that let you manipulate and mix sound files. It is designed to be a simple, easy to use set of tools. Echo is the simplest tool. It allows you to send sound back and forth using the same sound. Thus echo is a useful tool for testing, for example, if a sound is playing from one speaker and is then sent to another. Other tools include record, advance, and reverse. To record, you press record, then enter a frequency and a time. Entering a frequency will only make a record of sounds that are at or below that frequency. Entering a time will make a record of sounds that are at or below that frequency, for a given time. Recording is also capable of saving the files as a Windows Media file. Advanced is the next tool. Advanced allows you to record and then play back the sound that was recorded. It also lets you specify a volume, such as 0-255, for each frequency for a given recording. Reverse allows you to replay the sound from the recording at the time and frequency that you specified in the recording. Other tools include volume, port, and filter. Audio Lab Installation: Install the program using the file that is provided on the disc. Audio Lab

A program to play back and edit audio files. This program consists of four sections: -Data View -Waveform View -Tracks -Mixer Data View This section will display the data of a.wav,.voc, or.mp3 file that you want to use. There are about 20 properties that you can set with this section. The most important are play speed, fade in, and fade out. Waveform View Waveform View is a waveform display. It will display a.wav,.voc, or.mp3 file in a graphical form. Change the volume of sound using the scale on the top-right corner of the window. There are also three buttons below the scale. One of the buttons is a magnification button. In this section, you can also save the waveform of a sound as a.jpeg or.bmp picture. The saved image is stored as a file with the same name as the waveform (minus a.bmp extension). You can also play the saved waveform as a sound using Audio Lab. Tracks Tracks is a section to display multiple tracks of a sound. You can load.wav,.voc, or.mp3 files that are in one folder using this section. You can create your own separate folder to save your sounds. However, I recommend that you keep the saved sounds in the same folder as your current one to make your program work smoothly. Mixer The mixer is the most important part of this program. You can adjust the volumes of three tracks of a.wav,.voc, or.mp3 file. Each of the three tracks can be controlled by the volume buttons on the top. To control the volume of one of the tracks, you can select a track and use the two volume buttons on the bottom-right. You can also save the waveform of a sound as a.jpeg or.bmp picture. You can also load that picture as a.wav,.voc, or.mp3 file. Echo The echo function will play a part of a sound repeatedly, sometimes reversing it with the reverse option. The echo function can be useful to remove background sounds that are on your sound file. Additional Features: -You can use the tracks section to record a new sound file. -You can perform a time stretch on a sound file using the time stretch function in the mixer. -If you hold down the
